Changes the original file. Use this when making <b>single language</b> (all no. 2 files used for single language)             |
| <u>wch1</u>                                                                                 | wch1 V3-09 h                                                                             | <b>For Header Files. Capitalize,</b> adds numbers to words.txt file and then adds words to .xml file from words.txt. Changes the original file. Use this when making <b>single language</b> (all no. 2 files used for single language) |
| <u>cl</u>                                                                                   | cl V3-09                                                                                 | Clear lines of the file. Use without .xml extension                                                                                                                                                                                    |
| <u>clh</u>                                                                                  | clh V3-09                                                                                | Clear lines of header file. Use without .xml extension                                                                                                                                                                                 |
| <u>wn1</u>                                                                                  | wn1 V3-09 010                                                                            | Uses <u>numbersn.py</u> the start numbering with a given number. Used for Digha and Majjhima.                                                                                                                                          |
| <u>brc.bat</u>                                                                              | brc.bat<br>vinaya.xml                                                                    | Removes all BJT book entries and adds them from words.txt. Copy all book entries to words.txt before using this. Adds brackets to all lines.                                                                                           |
| <u>batch-with-file-list.txt</u>                                                             | Edit before each run. Copy the code to the command line.                                 | How to run a batch file for a list of files. Can copy files to a folder and use *.xml etc.                                                                                                                                             |
| <u>xml-loadYoutu<br/>be2-<br/>2output2.<br/>bat</u>                                         |                                                                                          | Add the xml file as input without extension. Writers the output to output2.txt . Used to convert from xml to expanding list. Non headings only.                                                                                        |
| <u>xml-headings-<br/>2output2.<br/>bat</u>                                                  |                                                                                          | Add the xml file as input without extension. Writers the output to output2.txt . Used to convert xml heading files to <b>&lt;summary&gt; ... &lt;/summary&gt; lines.</b>                                                               |

| File Name                                   | Format                                                                                                                                             | description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <u>xml-loadYoutubeStartStop-output2.bat</u> |                                                                                                                                                    | Add the xml file as input without extension. Writers the output to output2.txt . Used to convert from xml to expanding list. Non headings with <code>loadYoutubeStartStop('...')</code> only. It handles the last line with <code>loadYoutubeStart('...')</code> also                                                                                                                                                                                                                                                                                                              |
| <u>wh.bat</u>                               | <ul style="list-style-type: none"> <li>use this to add words from other languages to &lt;ul&gt; lists. Can use nested lists.</li> </ul>            | <p>joins input.txt and input2.txt, reads input.html<br/>- final output in output.html</p> <p>*** create input.html with correct YouTube link variable</p> <p>(words to html lists. add transliterated words to input.txt, duration and pages to input2.txt add word "blank" to blank lines in input2.txt, prepare input.html before running this. Then this combines input.txt and input2.txt put the word list to words.txt then add those words to input.html and final output is in output.html. this ignores the lines with &lt;/ul&gt; &lt;/details&gt;&lt;/li&gt; also.)</p> |
| <u>times.bat</u>                            | <ul style="list-style-type: none"> <li>use this to add times to &lt;ul&gt; lists. Can use nested lists. <b>Last line Start</b></li> </ul>          | <p>reads times.txt and output.html adds times.<br/>- final output in output3.html</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <u>times2.bat</u>                           | <ul style="list-style-type: none"> <li>use this to add times to &lt;ul&gt; lists. Can use nested lists. <b>Last line also StartStop</b></li> </ul> | <p>use this when all lines are javascript:loadYoutubeStartStop no javascript:loadYoutubeStart line in the end. No need to Remove last line in times-temp.txt.</p>                                                                                                                                                                                                                                                                                                                                                                                                                  |
