<u>numbersn.py</u>	<u>numbersn.py</u> <file_path> <start_number>	Can start numbering with a given number. Leading zero also preserved. Used for Digha and Majjhima.
<u>bjt.py</u>	<u>bjt.py</u> vinaya.xml	Change BJT book numbers in header files. Add lines to words.txt first. Must be a bracket () in the xml file to replace. Can use in X.xml files also.
<u>brackets.py</u>	<u>brackets.py</u> vinaya.xml	Removes any BJT book entries and adds () brackets to all lines. Then use <u>bjt.py</u> to add book numbers.
<u>replace.py</u>	<u>replace.py</u> file.xml	Used to replace header files links.

 File Name	 Format	 Description
	search_string replace_string	
<u>share.py</u>		Only used ones to make dhamma talk lists
<u>sharefile.py</u>		Only used ones to make dhamma talk lists
<u>xml-text-2words.py</u>		Extracts only the value inside <code>text="..."</code> Writes the cleaned output to words.txt
<u>words2summary.py</u>		For every line in the main input file, replace the content inside <code><summary> ... </summary></code> with the corresponding line from <code>word.txt</code> . Save the modified result to output2.txt
<u>words2button.py</u>		Read lines from <code>word.txt</code> . Replace the content inside the first <code><button ...> ... </button></code> in each line with the corresponding line from <code>word.txt</code> . Save the modified result to output.txt
<u>xml-loadYoutubebe2-2words.py</u>		Extracts only the variable inside <code>javascript:loadYoutube2('...');</code> from each line. Writes all extracted variables line by line to <code>words.txt</code> .
<u>words2-loadYoutubebe2-and-share.py</u>		For each line in the input file, replaces the text inside both: <code>loadYoutube2('...')</code> <code>sharePage('...')</code> with successive lines from <code>word.txt</code> .Writes the result to <code>output2.txt</code> .
<u>xml-loadYoutubebeStartStop-2words.py</u>		it extracts variables from both <code>javascript:loadYoutubeStartStop('...');</code> <code>javascript:loadYoutubeStart('...');</code> and then writes them line by line into <code>words.txt</code> .
<u>words2-loadYoutubebeStartStop</u>		If the function is <code>loadYoutubeStartStop('...')</code> or <code>sharePageStartStop('...')</code> → replace the <code>'...'</code> with successive lines from <code>words.txt</code> ,

📁 File Name	≡ Format	≡ Description
<u>p-and-share.py</u>		except the last line.If the function is <code>loadYoutubeStart('...')</code> or <code>sharePageStart('...')</code> → replace the <code>'...'</code> with the last line of <code>words.txt</code> .Write the result into <code>output2.txt</code> .
<u>xml-lines-loadYoutube2-words.py</u>		created to make input.txt with same number of lines. This only copies <code>loadYoutube2('...')</code> to words.txt file.
<u>xml-lines-loadYoutubeStartStop-p-2words.py</u>		created to make input.txt with same number of lines. This only copies <code>loadYoutubeStartStop('...')</code> and <code>loadYoutubeStart('...')</code> to words.txt file.
<u>words-loadYoutube2-input-lines.py</u>		This replaces the <code>loadYoutube2('...')</code> lines in words.txt with a string and output to input.txt
<u>words-loadYoutubeStartStop-p-2input-lines.py</u>		This replaces the <code>loadYoutubeStartStop('...')</code> and <code>loadYoutubeStart('...')</code> lines in words.txt with a string and output to input.txt
<u>xml-headings-lines-2words.py</u>		created to make input.txt with same number of lines. This only copies <code>src="any variable"</code> to words.txt file.
<u>words-heading-2input-lines.py</u>		This replaces the <code>src="any variable"</code> lines in words.txt with a string and output to input.txt
<u>check_share.py</u>		If variable1 = variable2 ignore, if variable1 not= variable2 output the line number to words.txt in loadYoutube2('variable1')

 File Name	 Format	 Description
		sharePage('variable2'). Used to check whether I updated the sharePage() variable in html lists.
<u>words2html-headings.py</u>		Adds words from words.txt to lines with headings in input.html and writes the output to output.html. Used to make lines.
<u>words2html-lines.py</u>		Adds words from words.txt to normal lines with chetiya in input.html and writes the output to output.html. Used to make lines.
<u>words2html-clear.py</u>		combined above 2 codes to add words to mixed lines.
<u>words2html.py</u>		Ignore </details> and continue replacing. useful for nested lists. From input.html output to output.html.
<u>join-all.py</u>		joins words in input.txt and input2.txt and outputs to wods.txt
<u>join.py</u>		avoids any lines containing the word "blank" in input2.txt. use this to combine page numbers, times to words. add transliterated words to input.txt and times to input2.txt
<u>times2.py</u>		edited <u>times.py</u> above. takes times from times.txt and stops after creating times-temp.txt. last line with one time (Start only).
<u>add-times.py</u>		add times from times-temp.txt to output.html and outputs to output2.html - last line must be javascript:loadYoutubeStart Can use nested lists.
<u>add-times2.py</u>		add times from times-temp.txt to output.html and outputs to output2.html - last line is also javascript:loadYoutubeStartStop. No need to Remove last line in times-temp.txt. Can use nested lists.
<u>copy-to-page.py</u>		Copy variables in javascript:loadYoutubeStartStop and javascript:loadYoutubeStart to sharePageSrartStop and sharePageSrart. replaces output2.html and creates output3.html
<u>timesdif.py</u>		Finds the difference between times and writes the output to dimes-dif.txt, uses times.txt for input. no command lind input.
<u>capital-</u>		Copies second occurrence from numbered line to the first

 File Name	 Format	 Description
<u>cyrillic1.py</u>		
<u>capital-cyrillic.py</u>		keeps the first letter in the first occurrence of the numbered lines and copies rest of the words from the second occurrence of the same number lines. used to correct capitalize problem in Cyrillic. Copy the same list of words in simple letters with same numbers to the same file at the end.
<u>remove_numbers.py</u>		Removes numbers and spaces from beginning of every line. input file name from command line. outputs to words.txt
<u>extract_words.py</u>	database	Only needed once to add youtube links from html to database. This extracts video title and youtube link from html files with loadYoutube2() First replace , with * in input.txt files. (Remove commas to join with other csv files.) then run: extract_words.py then run: UPDATE Talk_list SET video_title = REPLACE(video_title, '*', ',');
<u>add_hash.py</u>	database	Adds a # in the beginning of every line. used to replace it to add column names.
<u>merge_csv.py</u>	database	Unsuccessful - no problem in the script. 3. Compare the second variable in each line of the second csv file with the second variable of the first csv file and merge data. 4. If there are any extra lines in the first csv file ignore them. 5. Write the output to words.txt file.
<u>numbers.py</u>		<u>numbers.py</u> words.txt, simply add numbers to the beginning of each line. use for words.txt, uses command line argument.
